TLS bootstrapping

需要重复强调一个问题是: TLS bootstrapping 时的证书实际是由 kube-controller-manager 组件来签署的, 也就是说证书有效期是 kube-controller-manager 组件控制的; 所以在 1.7 版本以后(我查文档发现的从1.7开始有) kube-controller-manager 组件提供了一个 `-experimental-cluster-signing-duration` 参数来设置签署的证书有效时间; 默认为 8760h0m0s, 将其改为 87600h0m0s 即 10 年后再进行 TLS bootstrapping 签署证书即可。

TLS bootstrapping only sets up api client certificates for the kubelet currently. If you want a serving cert for the kubelet that is signed by the apiserver's `-kubelet-certificate-authority` you must provide it. Otherwise the kubelet generates a self-signed serving cert.

<https://github.com/kubernetes/kubernetes/issues/63164>

```
[root@k8s-master-etcd.10-12-3-12 cert]# openssl verify -CAfile ca.pem kubelet.crt
kubelet.crt: CN = 10.12.3.12@1535266843
error 20 at 0 depth lookup:unable to get local issuer certificate
[root@k8s-master-etcd.10-12-3-12 cert]#
[root@k8s-master-etcd.10-12-3-12 cert]# openssl verify -CAfile ca.pem kubelet-client-current.pem
kubelet-client-current.pem: OK
```

由于TLS bootstrapping生成的kubelet的服务端证书 (serving cert) 是一个自签名证书, metrics-server 访问kubelet 10250端口时, 会在日志中显示 “x509: certificate signed by unknown authority”。因此需要设置metrics-server参数`&insecure=true`

证书生成

使用 cfssl 工具

CA命令

[snippet.bash](#)

```
# cfssl gencert -initca ca-csr.json |cfssljson -bare ca
```

生成命令示例

snippet.bash

```
# cfssl gencert -ca=ca.pem -ca-key=ca-key.pem -config=ca-config.json -profile=k8sdev etcd-csr.json |cfssljson -bare etcd
```

ca-config.json

snippet.json

```
{
  "signing": {
    "default": {
      "expiry": "87600h"
    },
    "profiles": {
      "k8sdev": {
        "expiry": "87600h",
        "usages": [
          "signing",
          "key encipherment",
          "server auth",
          "client auth"
        ]
      }
    }
  }
}
```

ca-csr.json

snippet.json

```
{
  "CN": "k8sdev",
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "k8s",

```

```
    "OU": "Scloud"
  }
],
"ca": {
  "expiry": "87600h"
}
}
```

etcd-csr.json

[snippet.json](#)

```
{
  "CN": "etcd",
  "hosts": [
    "127.0.0.1",
    "192.168.53.205",
    "192.168.52.63",
    "192.168.56.143"
  ],
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "k8s",
      "OU": "Scloud"
    }
  ]
}
```

kubernetes-csr.json

这时给 apiserver 用的证书，可以加上 apiserver 的 vip 和 域名。

[snippet.json](#)

```
{
  "CN": "k8sdev",
  "hosts": [
    "127.0.0.1",
    "192.168.53.205",
    "192.168.52.63",
    "192.168.56.143",
```

```
"10.110.11.123",
"169.169.0.1",
"realdomain.xxx.com",
"kubernetes",
"kubernetes.default",
"kubernetes.default.svc",
"kubernetes.default.svc.cluster",
"kubernetes.default.svc.cluster.local"
],
"key": {
  "algo": "rsa",
  "size": 2048
},
"names": [
  {
    "C": "CN",
    "ST": "Beijing",
    "L": "Beijing",
    "O": "k8s",
    "OU": "Scloud"
  }
]
}
```

admin-csr.json

snippet.json

```
{
  "CN": "admin",
  "hosts": [],
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "system:masters",
      "OU": "Scloud"
    }
  ]
}
```

kube-controller-manager-csr.json

[snippet.json](#)

```
{
  "CN": "system:kube-controller-manager",
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "hosts": [
    "127.0.0.1",
    "192.168.56.143",
    "192.168.52.63",
    "192.168.53.205"
  ],
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "system:kube-controller-manager",
      "OU": "Scloud"
    }
  ]
}
```

kube-proxy-csr.json

[snippet.json](#)

```
{
  "CN": "system:kube-proxy",
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "k8s",
      "OU": "Scloud"
    }
  ]
}
```

kube-scheduler-csr.json

[snippet.json](#)

```
{
  "CN": "system:kube-scheduler",
  "hosts": [
    "127.0.0.1",
    "192.168.52.63",
    "192.168.56.143",
    "192.168.53.205"
  ],
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "system:kube-scheduler",
      "OU": "Sccloud"
    }
  ]
}
```

metrics-server-csr.json

[snippet.json](#)

```
{
  "CN": "aggregator",
  "hosts": [],
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "k8s",
      "OU": "Sccloud"
    }
  ]
}
```

front-proxy-ca-csr.json

snippet.json

```
{
  "CN": "k8sdev",
  "key": {
    "algo": "rsa",
    "size": 2048
  },
  "names": [
    {
      "C": "CN",
      "ST": "Beijing",
      "L": "Beijing",
      "O": "k8s",
      "OU": "Scloud"
    }
  ],
  "ca": {
    "expiry": "87600h"
  }
}
```

浏览器访问 **dashboard**

基于 admin 证书 生成 .pfx 证书

snippet.bash

```
openssl pkcs12 -inkey admin-key.pem -in admin.pem -export -out k8sdev-admin.pfx
```

然后浏览器上执行以下步骤

1. 导入 ca.pem 到 受信任的根证书
2. 导入 .pfx 证书
